Title of Presentation

Communication in the world of E-health: possibilities and pitfalls. How can we use these tools effectively?

1. Abstract

It is proven that the online documentation and transmission of symptoms can prolong the overall survival of cancer patients. Recent studies have shown that this advantage exists both in conventional chemotherapy and in oral therapy. Current implementations require a healthcare professional who monitors the data online. In most centers, such kind of human resources is not available except in clinical trials. To face these barriers, CANKADO is offering an easy workflow for patients and allows also quick overviews for the healthcare professionals.
